

An aerial photograph of Channel Islands Harbor, showing a coastal town with a large marina filled with boats, a sandy beach, and a pier extending into the ocean. The background features rolling hills and mountains under a clear blue sky.

Channel Islands Harbor

Water Quality Event
June & July, 2018

Presented by:

- Dr. David A. Caron
 - Professor of the Department of Biological Sciences, USC (since 1999)
 - Chief Science Officer of Aquatic EcoTechnologies, Inc.
 - Ph.D in Biological Oceanography conferred jointly by the Massachusetts Institute of Technology and the Woods Hole Oceanographic Institution
 - 250 scientific articles and book chapters on the ecology of microbes in marine and freshwater systems

- Mr. Scott C. Johnson
 - Senior Scientist/Laboratory Director, Aquatic Bioassay & Consulting Laboratories, Inc.
 - M.S. in Marine Biology
California State University Long Beach

Tonight's Presentation

- The Problem?
- The Response
- The Data
- Potential Causes of Water Quality Issue
- What's next?

The Problem

- “Dark murky water” reported in Channel Islands Harbor by the public beginning in early June
- Present throughout back basins, especially at Seabridge and Mandalay
- Strong odor accompanied murky water

The Response

- City collects water quality samples for:
 - Dissolved oxygen; pH; temperature; salinity – beginning mid-June
 - Nutrients
 - Bacteria
 - City hires marine biology team – July 5th

Oxnard Shores

Via Marina

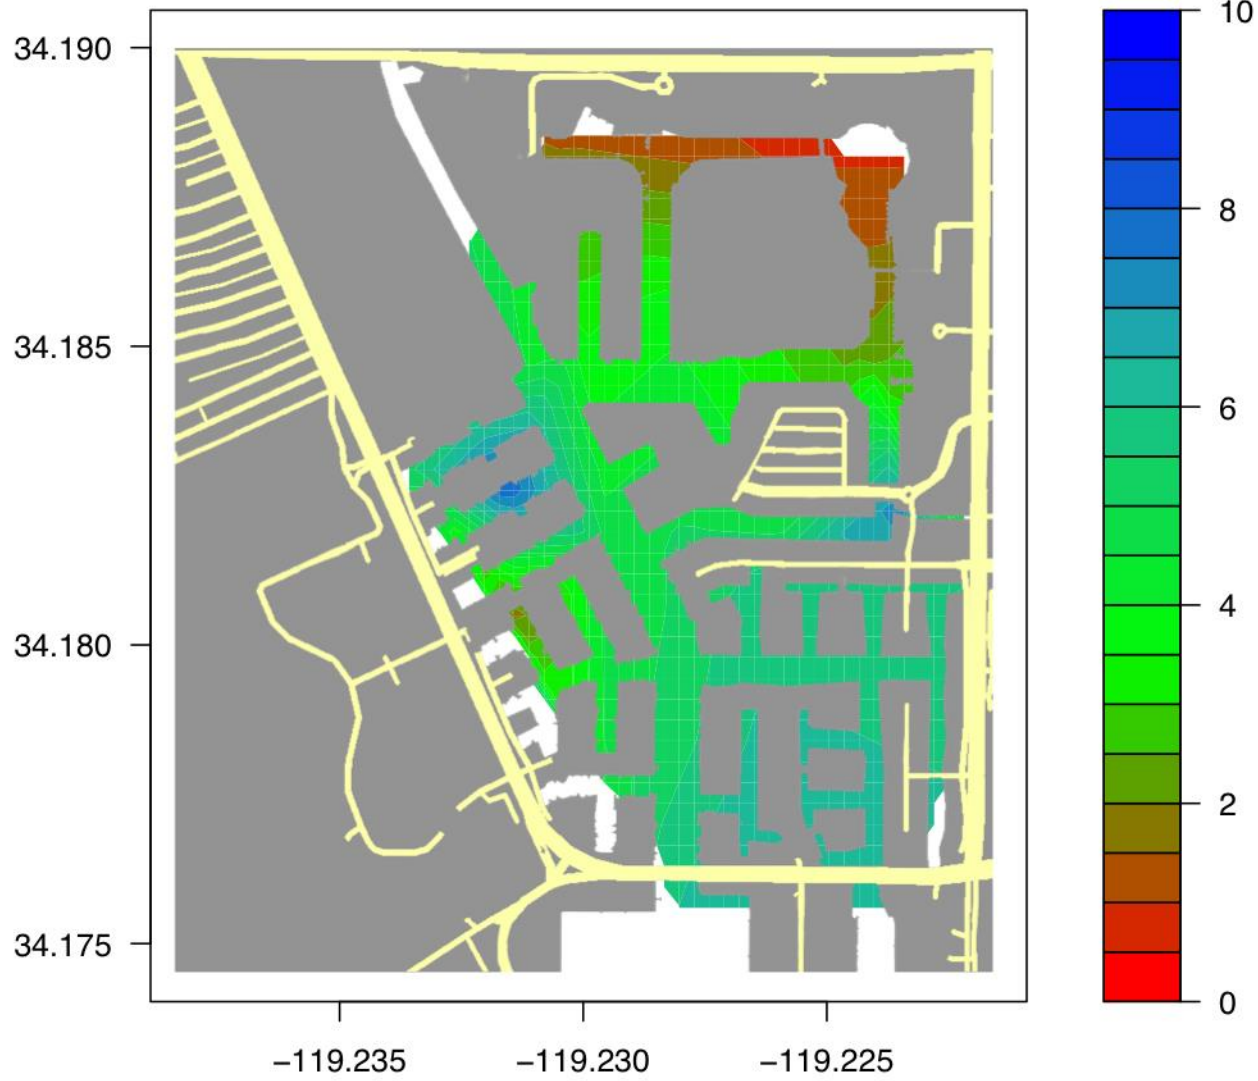

Channel Islands

The Response

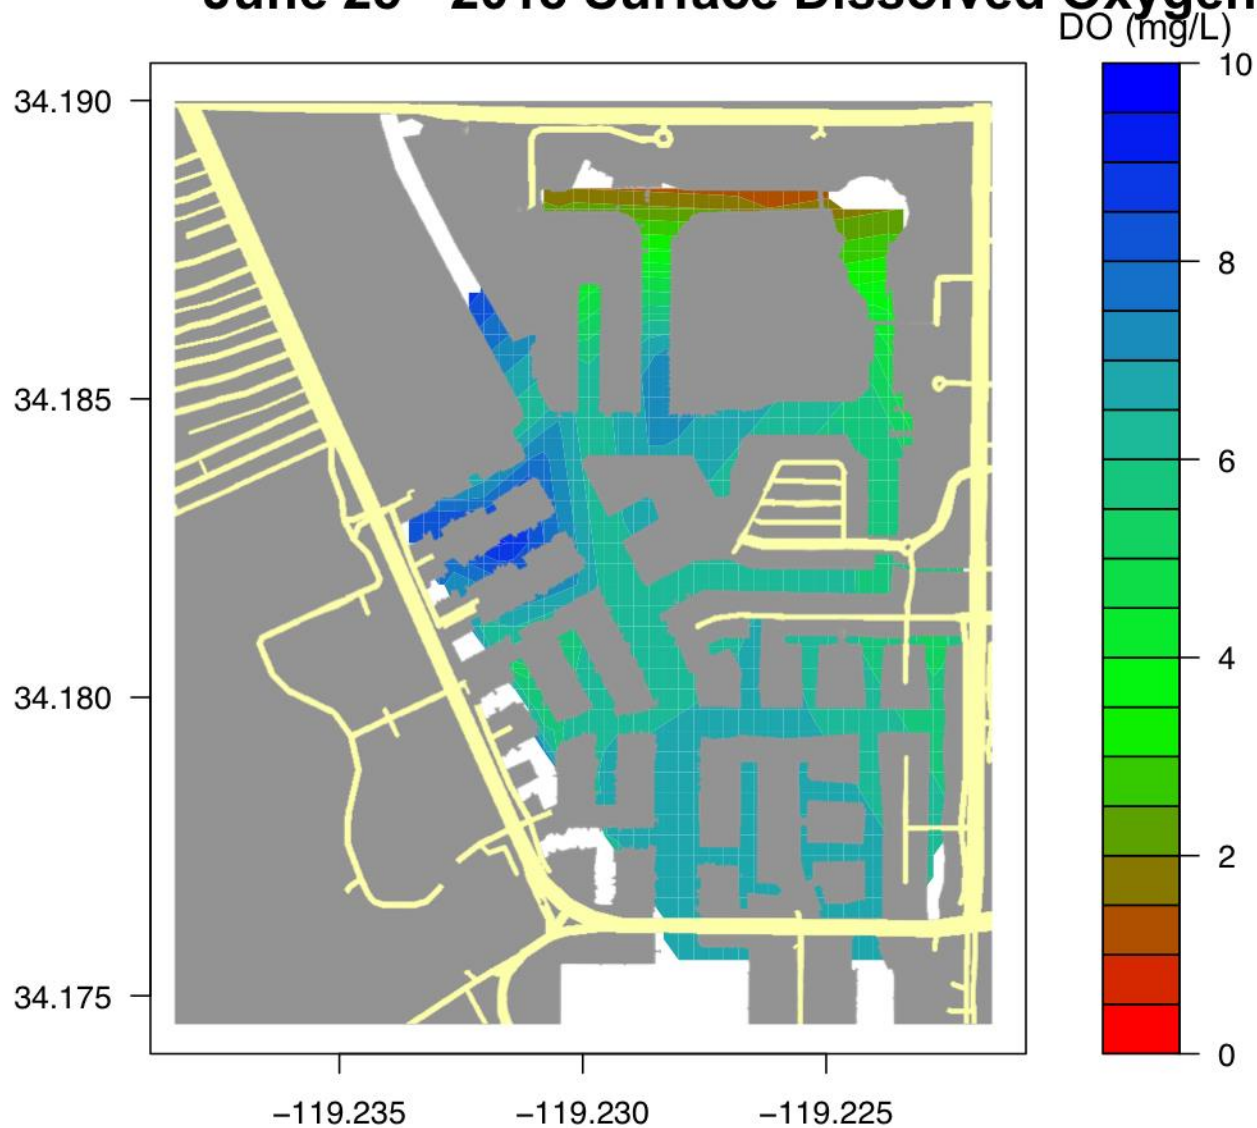

- Aquatic Bioassay & Aquatic EcoTechnologies collect samples at 11 locations for:
 - Water quality profiles: DO, pH, temp, chl a, salinity, transmissance
 - Phytoplankton & chl a
 - Nutrients: ammonia, nitrate, orthophosphate

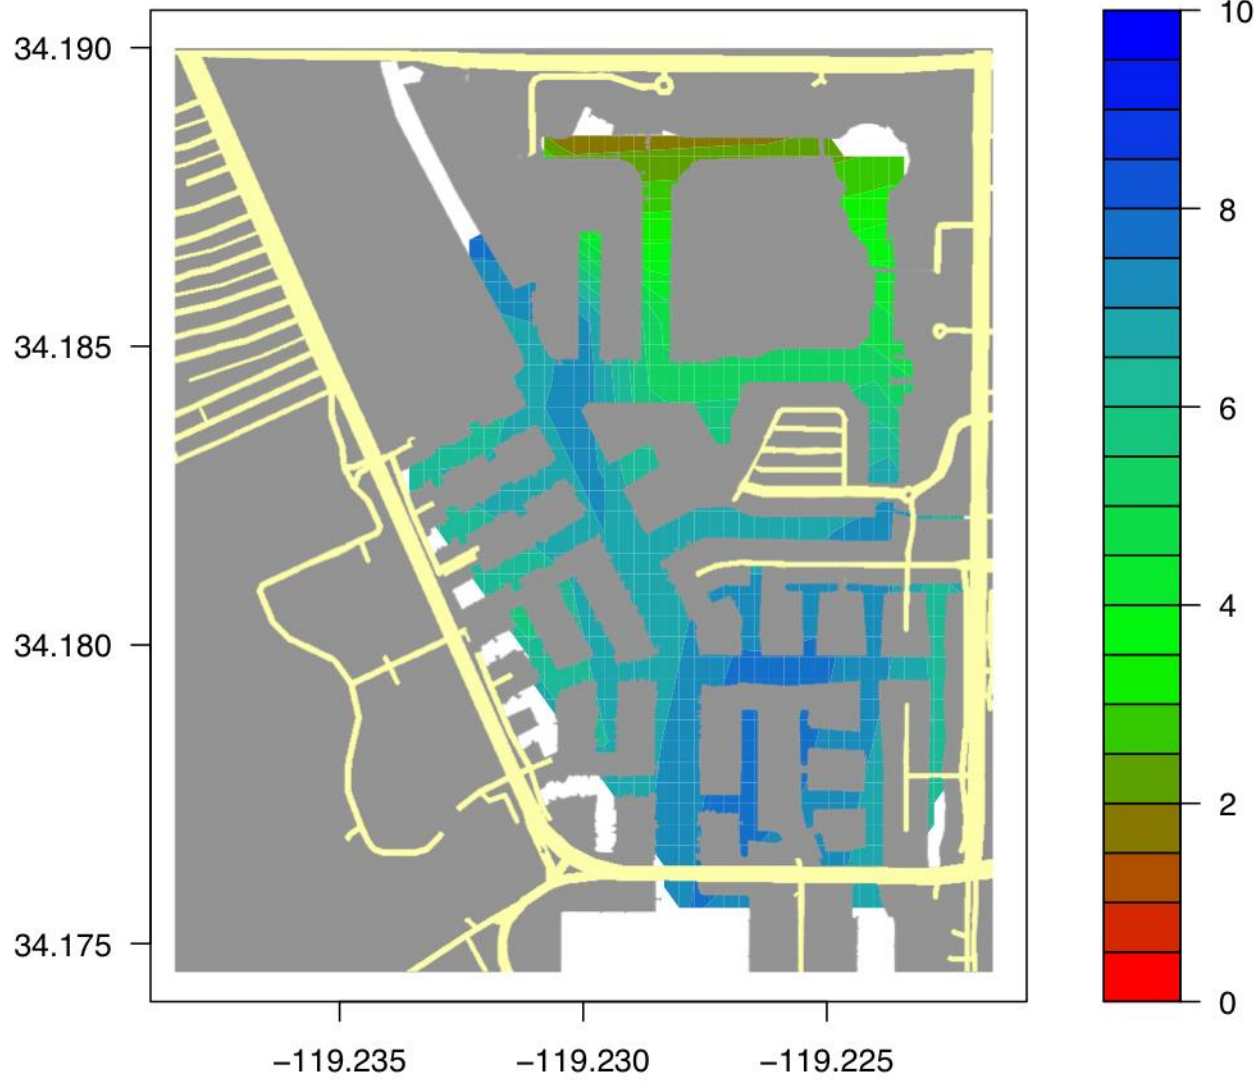

June 23rd 2018 Surface Dissolved Oxygen

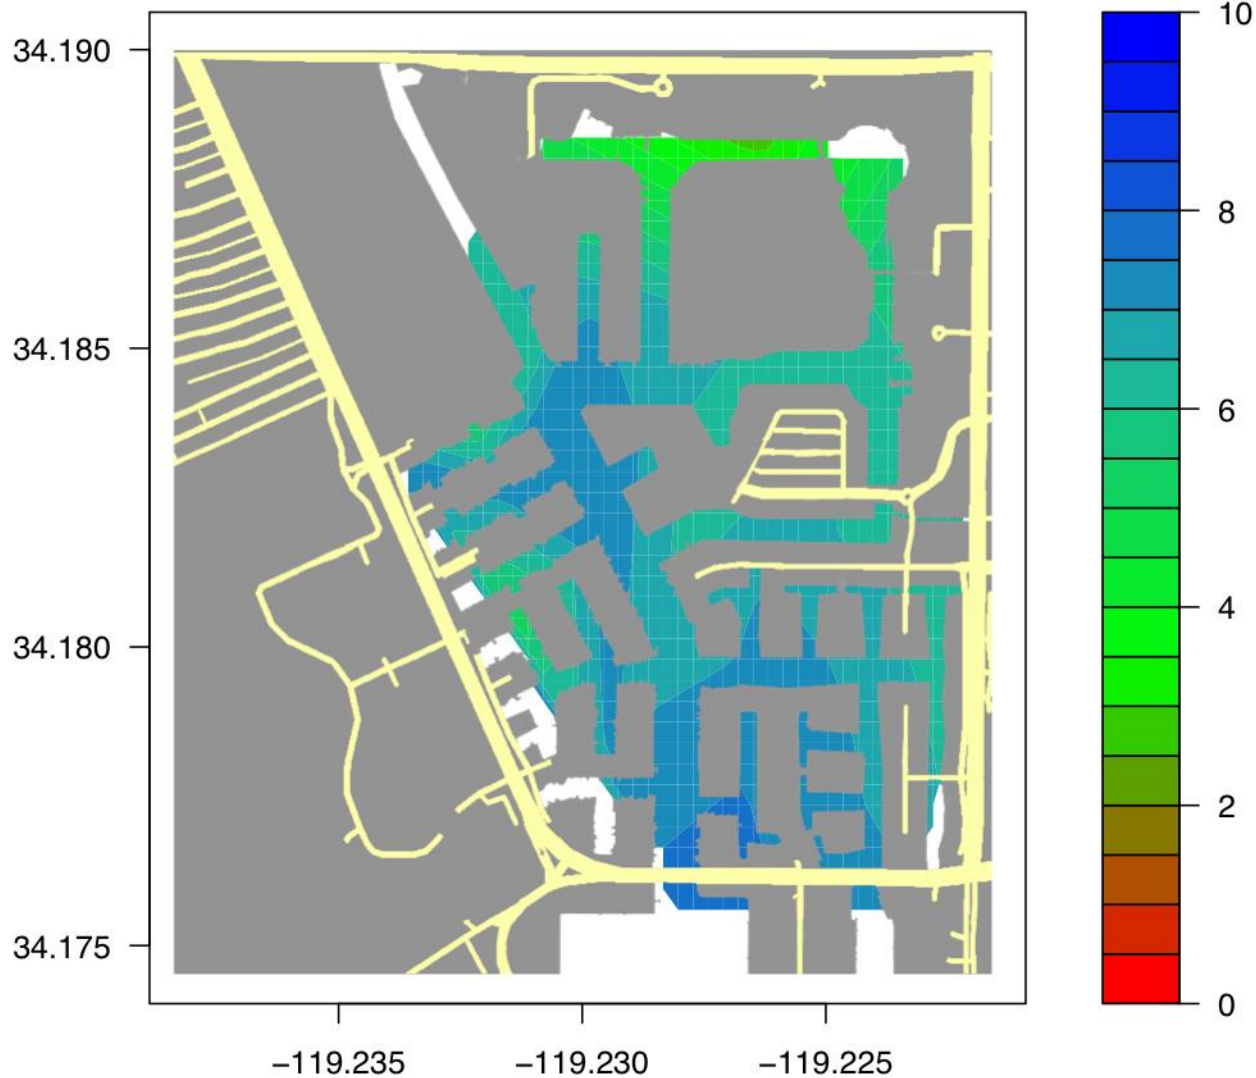

June 25th 2018 Surface Dissolved Oxygen

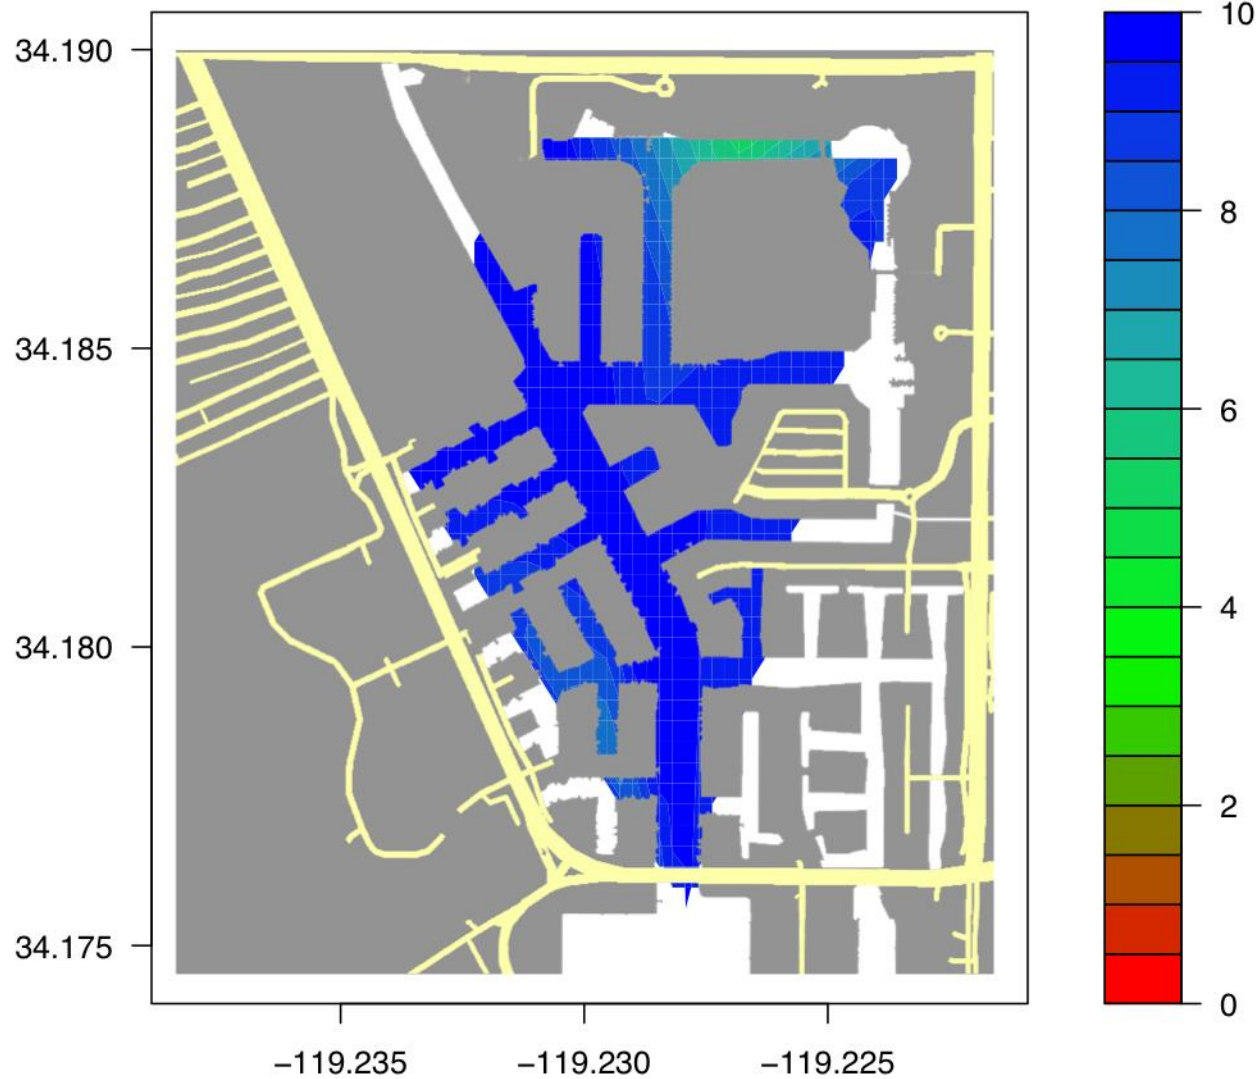

June 27th 2018 Bottom Dissolved Oxygen

June 29th 2018 Bottom Dissolved Oxygen

July 5th 2018 Bottom Dissolved Oxygen

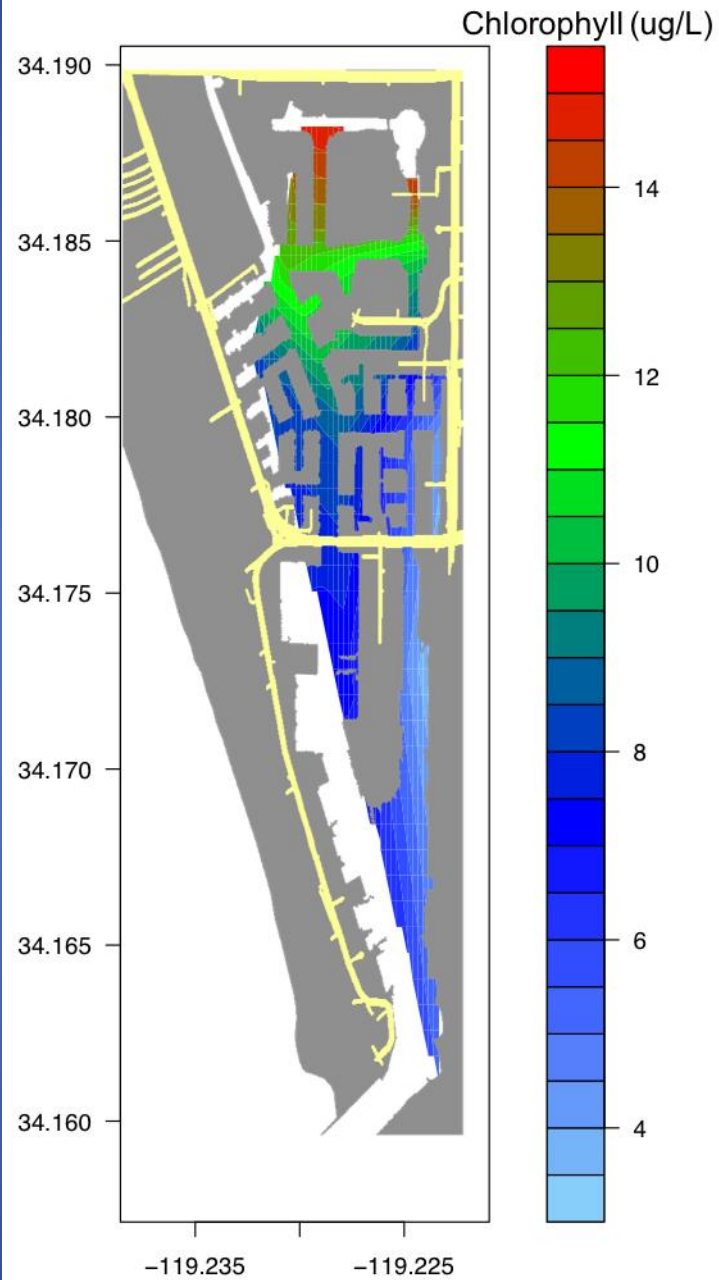

The Data

Bacteria: June 18th, 21st and 28th, 2018			Stations	REC1 Standard
	Method	MDL	Range (n = 16)	
Total Coliform	SM 9223 COLert	10 MPN/100 mL	<100 - 272	10,000
Fecal Coliform	SM 9223 COLert	10 MPN/100 mL	<10 - 63	400
Enterococcus	Enterolert	10 MPN/100 mL	<10 - 10	104

The Data

Nutrients: June 19th, 21st and 22nd 2018			Stations	Range	
			Range (n = 15)	Background	Of Concern
Nitrate	EPA 300.0	0.02 - 161.29 uM	ND	<1	>5
Nitrite	EPA 300.1	0.58 - 145 uM	ND - 1.7		
Total nitrogen (TKN)	EPA 351.2	3.57 uM	17.14 - 69.29	<10	>10 - 20
Ortho Phosphate	EPA 365.1	0.002 uM	0.16 - 1.05	<0.1	>1

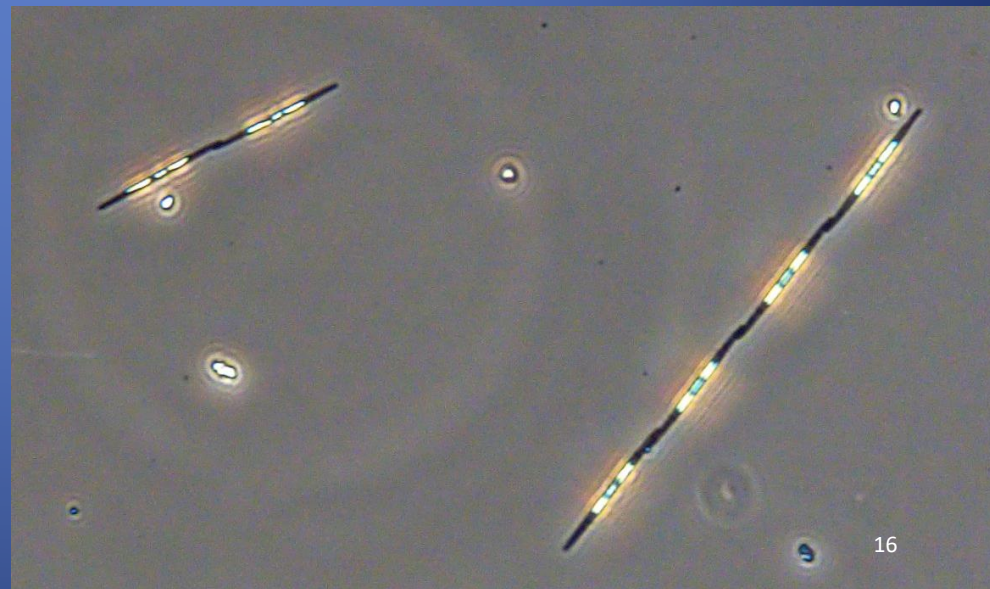

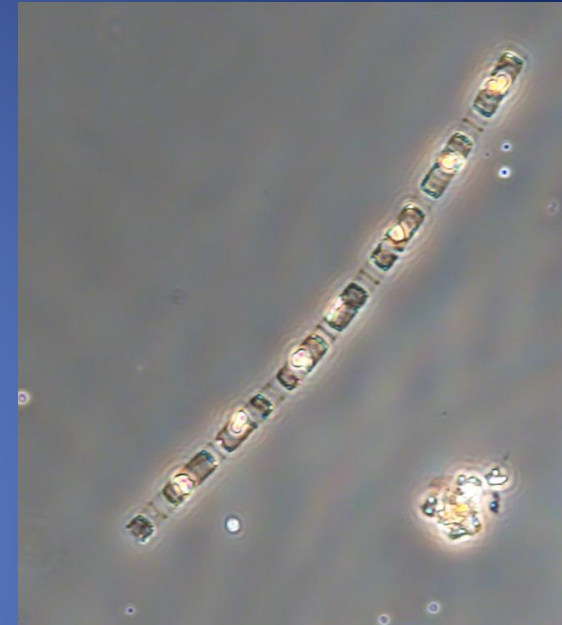

Phytoplankton composition (July 6, 2018)

Diatom genera:

Pseudo-nitzschia***
Skeletonema
Leptocylindrus
Chaetoceros
Nitzschia

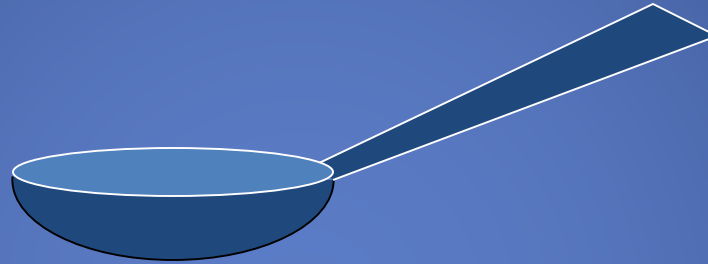

Other taxonomic groups:

Euglenoids***
Ciliated protozoa
Prorocentrum
Misc. small algae

Potential Causes of Water Quality Issue

What's in a teaspoon of seawater?

1 tsp of seawater \approx 5 milliliters

\approx 100,000,000 viruses

\approx 10,000,000 bacteria

\approx 5,000 microalgae

\approx 3,000 protozoa

most are harmless, even beneficial...
...a few are not.

SoCal 'Local' Harmful Algal Blooms

(from bad-to-worst)

Fairly innocuous 'red tides'

Mostly color, but lots of biomass

Noxious 'foams' and 'scums'

Food web disruption

Toxic truly species

Paralytic, amnesic, diarrhetic shellfish poisoning

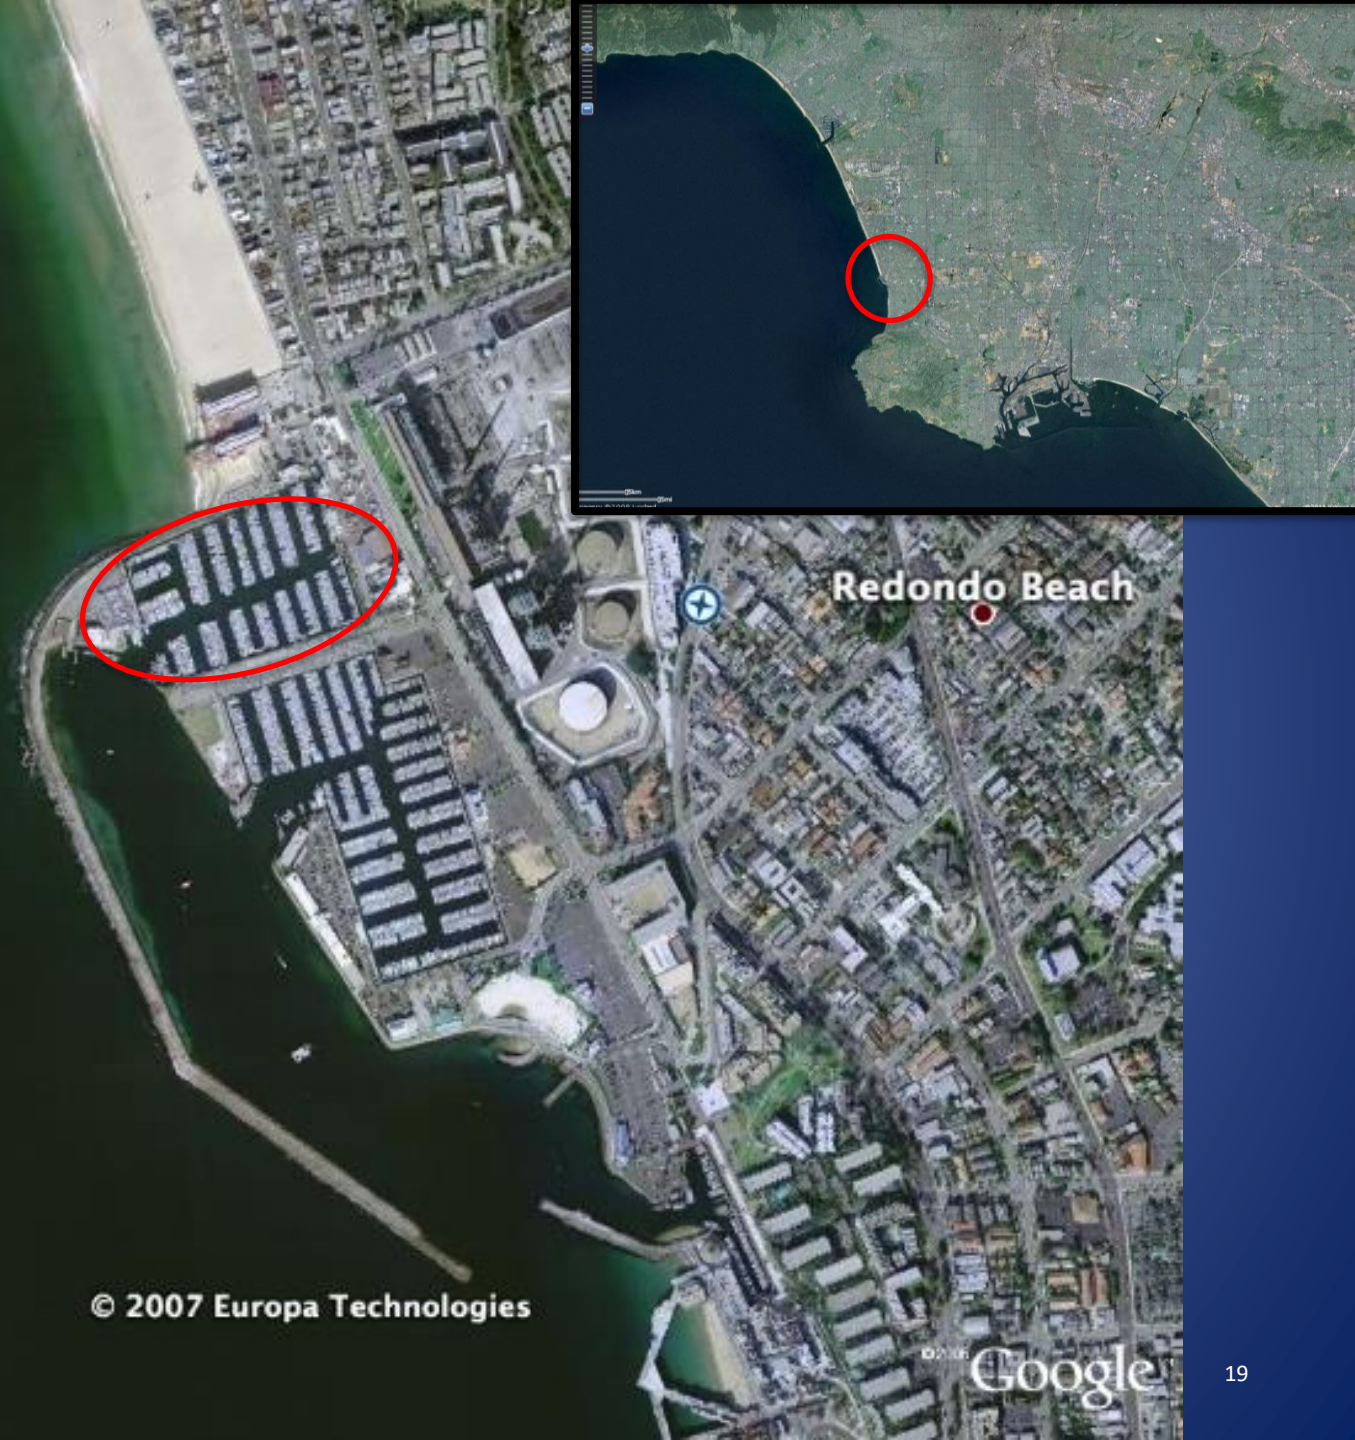

Newly introduced or newly recognized species:

Fish-killing taxa

Next Steps

- Finalize analysis of data collected on July 6th
- Reduce frequency of City WQ sampling to 2x's per week
- Two sampling events remaining on contract:
 - Await potential next event to sample at peak of bloom
- Install aerators in back basins
- Establish a Monitoring & Action Plan
 - Install remote sensor(s) to continuously monitor dissolved oxygen, pH and chlorophyll
 - Prepare action plan to mitigate water quality problems
